

PREPARATION FOR WINTER (THE FALL INSPECTION):

- The burner assembly will be cleaned.
- Soot will be removed from the fire side of the burner.
- The operation of the humidifier will be checked and cleaned.
- The heat exchanger will be inspected for cracks either visually or by remote camera.
- He will perform a combustion analysis and adjust the air/fuel ratio of the burner (the instrumentation that is used for combustion analysis is a means of fine-tuning the burner to achieve “optimum firing” and maximum fuel efficiency).
